

Parallel & Perpendicular Lines

In the picture, Segment AB is parallel to segment CD.

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

a. Find the slope of segment AB.

$$\text{slope } \overline{AB} = \frac{4-1}{6-2} = \frac{3}{4}$$

b. Find the slope of segment CD.

$$\text{slope } \overline{CD} = \frac{2-(-1)}{8-4} = \frac{3}{4}$$

c. What conclusion can be drawn about the slopes of parallel lines?

The slopes of parallel lines are equal (congruent)

In the picture, Segment AB is perpendicular to segment CD.

a. Find the slope of segment AB.

$$m_{\overline{AB}} = \frac{3}{4}$$

b. Find the slope of segment CD.

$$m_{\overline{CD}} = \frac{4-0}{2-5} = -\frac{4}{3}$$

c. What conclusion can be drawn about the slopes of perpendicular lines?

The slopes of perpendicular lines are negative reciprocals
(flip & negate)

Determine if the lines are parallel, perpendicular, or neither and explain why.

a. $y = 6x - 7$ $m = 6$
 $y = 6x + 1$ $m = 6$

The lines are parallel since the slopes are the same.

b. $2x - y = 8$
 $x + 2y = 10$

$$\begin{array}{r} 2x - y = 8 \\ + y + y \\ \hline 2x = y + 8 \\ - 8 \quad - 8 \\ \hline 2x - 8 = y \\ m = 2 \end{array}$$

$$\begin{array}{r} x + 2y = 10 \\ -x \quad -x \\ \hline 2y = -x + 10 \\ \frac{2y}{2} = \frac{-x + 10}{2} \\ y = -\frac{1}{2}x + 5 \\ m = -\frac{1}{2} \end{array}$$

The lines are \perp , the slopes are negative reciprocals.

c. $3x + 2y = 4$
 $5x + 3y = 9$

$$\begin{array}{r} 3x + 2y = 4 \\ -3x \quad -3x \\ \hline 2y = -3x + 4 \\ \frac{2y}{2} = \frac{-3x + 4}{2} \\ y = -\frac{3}{2}x + 2 \\ m = -\frac{3}{2} \end{array}$$

$$\begin{array}{r} 5x + 3y = 9 \\ -5x \quad -5x \\ \hline 3y = -5x + 9 \\ \frac{3y}{3} = \frac{-5x + 9}{3} \\ y = -\frac{5}{3}x + 3 \\ m = -\frac{5}{3} \end{array}$$

Neither.

d. $x = 8$
 $y = -3$

The lines are \perp since one is horizontal & one is vertical.

Find the equation of the line that passes through the point $(8, -2)$ and is parallel to the line $y = 2x + 3$?

point $(8, -2)$
 slope = 2

$$\begin{aligned} y - y_1 &= m(x - x_1) \\ y - (-2) &= 2(x - 8) \\ y + 2 &= 2(x - 8) \end{aligned}$$

$$\begin{array}{r} y + 2 = 2x - 16 \\ -2 \quad -2 \\ \hline y = 2x - 18 \end{array} \quad m = 2$$

or $y = 2x - 18$

Find the equation of the perpendicular bisector of \overline{AB} .

- ① passes thru midpt
- ② Forms a right angle

① slope = $-\frac{4}{8} = -\frac{1}{2}$

③ midpoint

$$M = \left(\frac{12+4}{2}, \frac{3+(-1)}{2} \right)$$

$$M = (8, 1)$$

$m = 2$

③ use point-slope
 $y - 1 = 2(x - 8)$

Putting it All Together

A **Mid-segment** of a triangle is a segment that connects the midpoints of 2 of the sides of the triangle.

- a. Create Mid-segment \overline{DE} by finding and connecting the midpoints of sides \overline{AB} and \overline{BC} .

\overline{DE} is a midsegment of $\triangle ABC$.

- b. Find the slopes of Mid-segment \overline{DE} and side \overline{AC} . What conclusion can you draw from your results?

$$\text{slope } \overline{DE} = \frac{1}{3}$$

$$\text{slope } \overline{AC} = \frac{2}{6} = \frac{1}{3}$$

\overline{DE} and \overline{AC} have equal slopes. So $\overline{DE} \parallel \overline{AC}$. So the midsegment is \parallel to the third side of the \triangle .

- c. Find DE and AC (remember this mean distance). What conclusion can you draw from your results?

$$\begin{aligned} DE &= \sqrt{1^2 + 3^2} \\ &= \sqrt{1 + 9} \\ &= \sqrt{10} \\ &\approx 3.16 \end{aligned}$$

$$\begin{aligned} AC &= \sqrt{2^2 + 6^2} \\ &= \sqrt{4 + 36} \\ &= \sqrt{40} \\ &\approx 6.32 \end{aligned}$$

$$AC = 2(DE)$$

The midsegment is half the length of the 3rd side of the triangle.
